## Community Health Education Program Helps Older Adults Build Practical Type 2 Diabetes Self-Management Skills

**CINCINNATI, Ohio - August 9, 2026** - A six-week health education program, *Managing Type 2 Diabetes in Seniors*, is designed to help adults age 65 and older strengthen practical skills for managing Type 2 diabetes in everyday life.

The program combines diabetes foundations, nutrition, physical activity, medication management, blood glucose monitoring, problem solving, foot care, long-term complication prevention, stress management, and support resources. Sessions are designed for a community health center or senior activity center and use interactive learning activities that account for varying levels of health literacy and mobility.

A featured session, *Move for Better Blood Sugar*, focuses on safe physical activity. Participants discuss benefits of movement, practice accessible chair-based activities, review safety considerations, and create a realistic one-week movement goal.

The overall program emphasizes manageable behavior changes rather than perfection. Participants are encouraged to work with their healthcare teams and select strategies that fit their health status, ability, and care plan.

**Program audience:** Adults age 65+ managing Type 2 diabetes

**Format:** Six weekly health education sessions

**Setting:** Community health center or senior activity center
